

PROJECT MANAGEMENT TOOL

Python Full Stack Internship Project Report

Student	Rakshitha M V
Course	B.E. – Computer Science & Engineering
Internship Domain	Python Full Stack
Project Type	Web-Based Project Management Application
Technologies	Python, Django, HTML, CSS, Bootstrap, JavaScript, MySQL/SQLite

1. Project Overview

The Project Management Tool is a web-based application developed as part of a Python Full Stack Internship. The application is designed to help users organize projects, manage tasks, assign work, monitor deadlines and progress, collaborate with team members, share files, generate reports, and track time spent on tasks.

2. Objectives

The main objective was to develop a practical project management platform while applying full-stack development concepts. The project focuses on project organization, task tracking, collaboration, progress monitoring, reporting, and time management.

3. Key Features

Feature	Description
Project Management	Create, view, update, and manage projects.
Task Management	Create tasks, assign team members, set priorities, and manage deadlines.
Progress & Timeline	Monitor project progress and view timeline/Gantt-style progress information.
Team Collaboration	Support comments, mentions, and activity updates.
File Sharing	Upload and manage project and task-related files.
Kanban Board	Visually organize tasks and update their status using drag-and-drop.
Reports & Analytics	Display project and task information through reports and analytics.
Time Tracking	Record and monitor time spent working on tasks.

4. Technologies Used

- Backend:** Python and Django
- Frontend:** HTML, CSS, Bootstrap, JavaScript
- Database:** MySQL during development and SQLite for the deployed environment

Version Control: Git and GitHub

Deployment: PythonAnywhere

5. Development Process

The project was developed in stages: project setup and virtual environment creation, database configuration, Django models and migrations, views and URL routing, template development, project and task management, Kanban and reporting features, testing, and deployment. GitHub was used to maintain and publish the project source code.

6. Learning Outcomes

This internship project provided hands-on experience with Django application structure, models, views, templates, URL routing, CRUD operations, database management, JavaScript interactions, file handling, Git/GitHub, testing, and deployment. It also improved practical problem-solving and understanding of how individual features are integrated into a complete web application.

YouTube Demo: <https://youtu.be/ppp86dd7Aow>

8. Conclusion

The Project Management Tool was completed as a practical Python Full Stack internship project. It combines project and task management with collaboration, file sharing, Kanban-based task organization, reporting, analytics, timeline tracking, and time tracking. The project helped translate academic knowledge into a working web application and provided valuable experience in developing, testing, and deploying a full-stack project.
